## Notes:

1. The exam is closed books/closed notes - except for one page of notes.
2. Please show ALL work. Incorrect answers with no supporting explanations or work will be given no partial credit.
3. Please indicate clearly your answer to the problem. If I can't read it (and I am the judge of legibility), it is wrong. If I can't follow your solution (and I get lost easily), it is wrong. All things being equal, neat and legible work will get the higher grade:)

## Problem No. 1: Modeling Concepts

(a) Prove whether the signal $x(t)=t e^{-\alpha t} u(t)$ is an energy signal or power signal.

By definition of an Energy Signal: $\int_{0}^{\infty}\left|t e^{-\alpha t}\right|^{2} d t=\int_{0}^{\infty} t^{2} e^{-2 \alpha t} d t$
And using the identity: $\quad \int_{0}^{\infty} t^{m} e^{-\alpha t}=\frac{m!}{\alpha^{n+1}}$
we see that:

$$
E=\frac{1}{4 \alpha^{3}}
$$

Obviously this is a finite signal and using the definition of an energy signal ( $0<\mathrm{E}<$ inifity) we can show that it is in the range and therefore an Energy Signal.
(b) Is the signal $x(t)=\sin ^{2} \omega_{0} t$ periodic? If so, what is its period? If not, explain.

This signal is periodic because it satsifies the following conditions:

$$
\begin{aligned}
& x(t)=x\left(t+T_{0}\right) \\
& x\left(t+T_{0}\right)=\left(\sin \omega_{0}\left(t+T_{0}\right)\right)^{2} \\
& =\left(\sin \omega_{0}\left(t+2 \frac{\pi}{\omega_{0}}\right)\right)^{2} \\
& =\left(\sin \omega_{0} t\right)^{2}
\end{aligned}
$$

Therefore, the condition holds, proving that this signal is periodic. The period can be found by showing:

$$
\left(\sin \omega_{0} t\right)^{2}=\frac{1}{2}-\frac{1}{2} \cos 2 \omega_{0} t \text { so } T_{0}=\frac{\pi}{\omega_{0}}=\frac{1}{2 f_{0}}
$$

(c) Write the following signal in terms of a weighted sum of a combination of one or all of the following functions: $\delta(t), u(t), r(t)$.

$$
x(t)=4 r(t+1)-8 r\left(t+\frac{1}{2}\right)+4 r(t)
$$

(d) Compute the energy value of the signal in (c).

$$
E=2 \int_{0}^{0.5}(4 t)^{2} d t \quad=\quad 2\left(\left.\left(\frac{16}{3}\right) t^{3}\right|_{0} ^{0.5}\right) \quad=1.33 \text { Joules }
$$

## Problem No. 2: Time-Domain Solutions

Consider the signal and system (completely described by its impulse response):

(a) Compute and plot output, $y(t)$, for the system shown above.

The lower time limit of $y(t)$, which is the time that the output signal starts, is

( Should be symmetric about the y axis)
equal to the lower time limit of $x(t)+$ the lower limit of $h(t) .1+(-2)=-1$, so -1 is where the output starts and the upper limit of $y(t)$ is equal to the upper time limit of $x(t)+$ the upper time limit of $h(t) .2+(-1)=1$, so 1 is where the output ends. The maximum amplitude is equal to the maximum area shared between $x(t)$ and a convolved $h(t)$. The output is computed by the following:

$$
\begin{aligned}
& y(t)=(0,(t<-1),(t>1)) \\
& x(t)=(t-1), 1 \leq t \leq 2 \\
& h(t)=(t+2),-2 \leq t \leq-1 \\
& \int_{-2}^{(t-1)}(t-\lambda-1) d \lambda=-\frac{t^{2}}{6}+\frac{t}{2}+\frac{1}{3},-1 \leq t \leq 0
\end{aligned}
$$

$$
-\int_{(t-2)}^{-1}(t-\lambda-1)(\lambda+1) d \lambda=\frac{t^{2}}{6}-\frac{t}{2}+\frac{1}{3}, 0 \leq t \leq 1
$$

(b) Without using the answer to part (a), explain whether the system is causal.

As stated in class: the system is obviously non-causal because $h(t)$ is not 0 for negative values of time.
(c) Use your answer to part (a) to support your reasoning given in (b).

Looking at the graphs, output $y(t)$ anticipates input $x(t)$. We know that $y(t)$ is anticipatory because $y(t)$ begins at -1 , while $x(t)$ does not begin until 1 . Therefore, the system is by definition noncausal.
(d) Describe the system using as many system modeling concepts as possible (for example, linearity). Justify your answers.

Time invariant - unit functions do not depend on time
Aperiodic - no period
Instantaneous - no memory elements
Linear - superposition holds
Non-causal - explained above

## Problem No. 3: Fourier Series

Given the signal $x(t)=3 \sin \left(1.5 \omega_{1} t\right)+5 \cos \left(1.75 \omega_{1} t\right)$,
(a) Using symmetry arguments, explain which Fourier coefficients of the trigonometric Fourier Series will be zero (\{an\} and \{bn\}). Be careful and be precise :)

By inspection, the signal has no constant, or DC value. The signal propagates about zero with no offset, so this signal has an average value of zero. Therefore, $a_{0}=0$, and all other coefficients are nonzero. This argument is supported by the mathematical evidence below:

If $x(-t)=x(t)$, then the function is even, and if $x(-t)=-x(t)$, then the function is odd.

$$
\begin{aligned}
& x(t)=\left(3 \sin \left(1.5 \omega_{1} t\right)\right)+\left(5 \cos \left(1.75 \omega_{1} t\right)\right) \\
& x(-t)=\left(3 \sin \left(-1.5 \omega_{1} t\right)\right)+\left(5 \cos \left(-1.75 \omega_{1} t\right)\right) \\
& -x(t)=-\left(3 \sin \left(1.5 \omega_{1} t\right)\right)-\left(5 \cos \left(1.75 \omega_{1} t\right)\right)
\end{aligned}
$$

since $\mathrm{x}(-\mathrm{t})$ does not equal $\mathrm{x}(\mathrm{t})$, and $\mathrm{x}(-\mathrm{t})$ does not equal $-\mathrm{x}(\mathrm{t})$, neither $a_{n}$ nor $b_{n}$ will be zero.
(b) Compute the Fourier series coefficients.

The signal $x(t)$ is already in standard form for a Trigonometric Fourier Series:

$$
\begin{aligned}
& x(t)=a_{0}+\sum_{n=1}^{\infty}\left(\left(a_{n} \cos n \omega_{0} t\right)+\left(b_{n} \sin n \omega_{0} t\right)\right) \\
& x(t)=\left(3 \sin 1.5 \omega_{1} t\right)+\left(5 \cos 1.75 \omega_{1} t\right)
\end{aligned}
$$

It can easily be seen that the above series is periodic with a fundamental frequency, $f_{0}=\frac{f_{1}}{4}$, which can be transformed into $\omega_{1}=4 \omega_{0}$. Using this relationship, we can now determine the Fourier coefficients of the series. Knowing the properties of integrals involving the products of sines and cosines it can be shown:

$$
I_{1}=\int_{T_{0}}\left(\sin m \omega_{0} t\right) \sin n \omega_{0} t d t=0, m \neq n
$$

and

$$
\begin{aligned}
& I_{1}=\frac{T_{0}}{2}, m=n \neq 0 \\
& I_{2}=\int_{T_{0}}\left(\cos m \omega_{0} t\right)\left(\cos n \omega_{0} t\right) d t=0, m \neq n
\end{aligned}
$$

and

$$
I_{2}=\frac{T_{0}}{2}, m=n \neq 0
$$

we know that $1.75 \omega_{1} t=n \omega_{0} t$, so the following is true:

$$
\begin{aligned}
& 1.75 \omega_{1}=n \omega_{0} \\
& n=1.75 \frac{\omega_{1}}{\omega_{0}} \\
& n=1.75 \frac{\left(4 \omega_{0}\right)}{\omega_{0}} \\
& n=7
\end{aligned}
$$

Therefore, $a_{7}=\frac{T_{0}}{2}$.

Using the same argument for $b_{n}$, we see that:

$$
\begin{aligned}
& 1.5 \omega_{1}=n \omega_{0} \\
& n=1.5 \frac{\omega_{1}}{\omega_{0}} \\
& n=1.5 \frac{\left(4 \omega_{0}\right)}{\omega_{0}} \\
& n=6
\end{aligned}
$$

Therefore, $b_{6}=\frac{T_{0}}{2}$. So there are only two coefficients for this series, $a_{7}$ and $b_{6}$. All other coefficients are zero.
