In a meeting today, Brian showed me CyberDuck, a tool that lets you remotely browse the cluster:

<https://cyberduck.io/download/>

Phuykong has been an advocate of this tool. Our students with Windows laptops use a similar tool, Bitvise, to remotely browse directories.

I downloaded it and installed it today and it seems to work really well. I know we have discussed tools like this before, but I wasn't aware that the Mac version had advanced.

I'd recommend installing it if you are a Mac user.

Thanks to Phuykong/Brian for discovering this.

-Joe
